IN THE CLAIMS

- 1 (Previously Presented). A method comprising:

 enumerating a plurality of devices in a first radio frequency network;

 communicating address information about the devices in said first radio frequency
 network over a non-radio frequency network to a second radio frequency network; and

 making the address information about the devices in the first radio frequency
 network available to devices in said second radio frequency network.
- 2 (Original). The method of claim 1 including automatically enumerating a plurality of devices in a Bluetooth radio frequency network.

Claim 3 (Canceled).

- 4 (Previously Presented). The method of claim 1 including communicating information about said first radio frequency network over a telephone network.
- 5 (Original). The method of claim 1 including enumerating a plurality of devices in a second radio frequency network.
- 6 (Original). The method of claim 5 including combining said first and second radio frequency networks into a combined radio frequency network.
- 7 (Previously Presented). The method of claim 6 including enabling any device in said first radio frequency network to communicate through a telephone call with any device in said second radio frequency network.
- 8 (Previously Presented). The method of claim 7 including transmitting data between said first and second radio frequency networks through said telephone call at the same time that a voice communication is ongoing between a device in said first radio frequency network and a device in said second radio frequency network.

- 9 (Previously Presented). The method of claim 8 including enumerating a cellular telephone as said first and second telephones.
- 10 (Original). The method of claim 9 wherein one of said cellular telephones acts as a proxy for the devices in said first radio frequency network and the other of said cellular telephones acts as a proxy for the devices in said second radio frequency network.
- 11 (Previously Presented). An article comprising a computer storage medium storing instructions that, if executed, enable a processor-based system to:
- enumerate a plurality of devices in a first radio frequency network;

 communicate address information about the devices in said first radio frequency
 network over a non-radio frequency network to a second radio frequency network; and

 make the address information about the devices in the first radio frequency
 network available to devices in said second radio frequency network.
- 12 (Original). The article of claim 11 further storing instructions that enable the processor-based system to automatically enumerate a plurality of devices in a Bluetooth radio frequency network.
- 13 (Original). The article of claim 11 further storing instructions that enable the processor-based system to develop enumeration data for a plurality devices in a first radio frequency network and communicate that enumeration data over a non-radio frequency network.
- 14 (Original). The article of claim 13 further storing instructions that enable the processor-based system to develop communications about said first radio frequency network over a telephone network.
- 15 (Original). The article of claim 11 further storing instructions that enable the processor-based system to receive enumeration data from a plurality of devices in a second radio frequency network coupled to said first radio frequency network by said non-radio frequency network.

- 16 (Original). The article of claim 15 further storing instructions that enable said processor-based system to combine said first and second radio frequency network enumeration data to develop a combined radio frequency network.
- 17 (Currently Amended). The article of claim 16 further storing instructions that enable the processor-based system to enable any device in said first radio frequency network to communicate via said call with any device in said second radio frequency network.
- 18 (Previously Presented). The article of claim 17 further storing instructions that enable the processor-based system to transmit data from said first to said second radio frequency network via said call at the same time that a voice communication is ongoing between a device in said first radio frequency network and a device in said second frequency network.
- 19 (Original). The article of claim 18 further storing instructions that enable the processor-based system to implement cellular radio frequency communications.
- 20 (Original). The article of claim 19 further storing instructions that enable a cellular telephone in said first radio frequency network to act as a proxy for other devices in said first radio frequency network.
 - 21 (Previously Presented). A device comprising:
 - a radio frequency receiver;
 - a radio frequency transmitter; and
- a processor to enumerate devices in a first radio frequency network and to enumerate a plurality of devices in a first radio frequency network, communicate address information about the devices in said first radio frequency network over a non-radio frequency network to a second radio frequency network, and make the address information about the devices in the first radio frequency network available to devices in said second radio frequency network.

- 22 (Original). The device of claim 21 wherein said radio frequency transmitter includes a cellular radio frequency transmitter.
- 23 (Original). The device of claim 22 wherein said transmitter includes a Bluetooth transmitter.
- 24 (Original). The system of claim 21 including a transmitter to transmit information over at least two different radio frequency networks as well as a telephone network.
- 25 (Original). The device of claim 24 including a transmitter to transmit over a cellular telephone network and a Bluetooth network.
- 26 (Original). The device of claim 21 wherein said processor is programmed to receive enumeration data over a non-radio frequency network so as to combine the first radio frequency network with a second radio frequency network over said non-radio frequency network.
- 27 (Original). The device of claim 21 including a receiver and a transmitter to implement a telephone link while simultaneously exchanging data received over a separate radio frequency link.
 - 28 (Original). The device of claim 21 wherein said transmitter packetizes voice data.
- 29 (Original). The device of claim 28 wherein said transmitter packetizes enumeration data and transmits it with packetized voice data.
- 30 (Original). The device of claim 29 wherein said device is a Bluetooth and cellular transceiver.
